

EnviCheck CO₂-Footprint

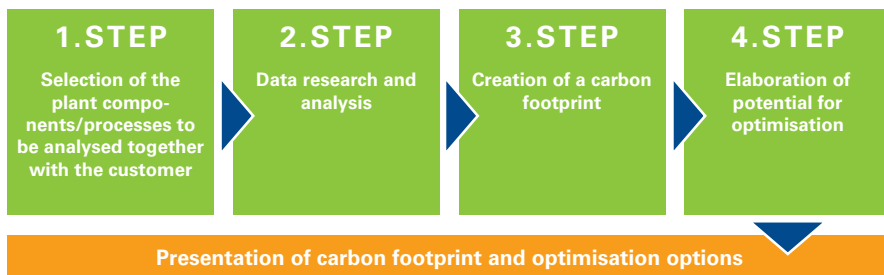

We calculate the carbon footprint
of your wastewater treatment plant.

EnviCheck

We calculate your plant's carbon emissions and show you which processes significantly impact your carbon footprint, as well as how optimisations can reduce carbon emissions.

Determining the carbon footprint of industrial (waste)water treatment in 4 steps

Goals (examples):

- Carbon footprint for the entire wastewater treatment process
- Proposed solutions for minimising the carbon footprint
- Evaluation of alternative technologies
 - Water reuse
 - Recycling of resources
- Alternatives for sludge disposal
- Cost-cutting options

The carbon footprint calculation can also be performed on plants that were not built by EnviroChemie
