

EnviCheck

We put your wastewater and water treatment plants to the test

EnviCheck

We test your system and record the current status, before showing you how to optimise it.

The EnviCheck optimisation concept in 4 steps

Goals (examples):

- Lowering costs by reducing energy requirements, chemical input and/or sludge volume
- Compliance with discharge limits
- Testing capacity for new hydraulic loads and/or new pollutant loads (e.g. when changes are made in production)
- Testing processes and plant technology

Important: EnviCheck can also be performed on plants that were not built by EnviroChemie!
